Date	25 August 2026
Project Name	**Employee Raise Issue**
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming for Employee Support Request System in ServiceNow involves generating ideas to simplify how employees raise and track workplace concerns. Suggestions include a centralized portal, automated routing, priority levels, progress tracking, and notifications. Each idea is evaluated for feasibility, usefulness, and impact on efficiency. The overall aim is to improve employee satisfaction and reduce delays in service delivery, ensuring a reliable and transparent management process.

Step-1: Team Gathering, Collaboration and Select the Problem Statement :

The team identifies the difficulties employees experience while requesting workplace support. Employees often struggle with knowing which department should handle their request, have limited visibility into the progress of their request, and may not receive timely updates. These challenges lead to confusion, delays, and reduced satisfaction in the workplace.

Problem Statement:

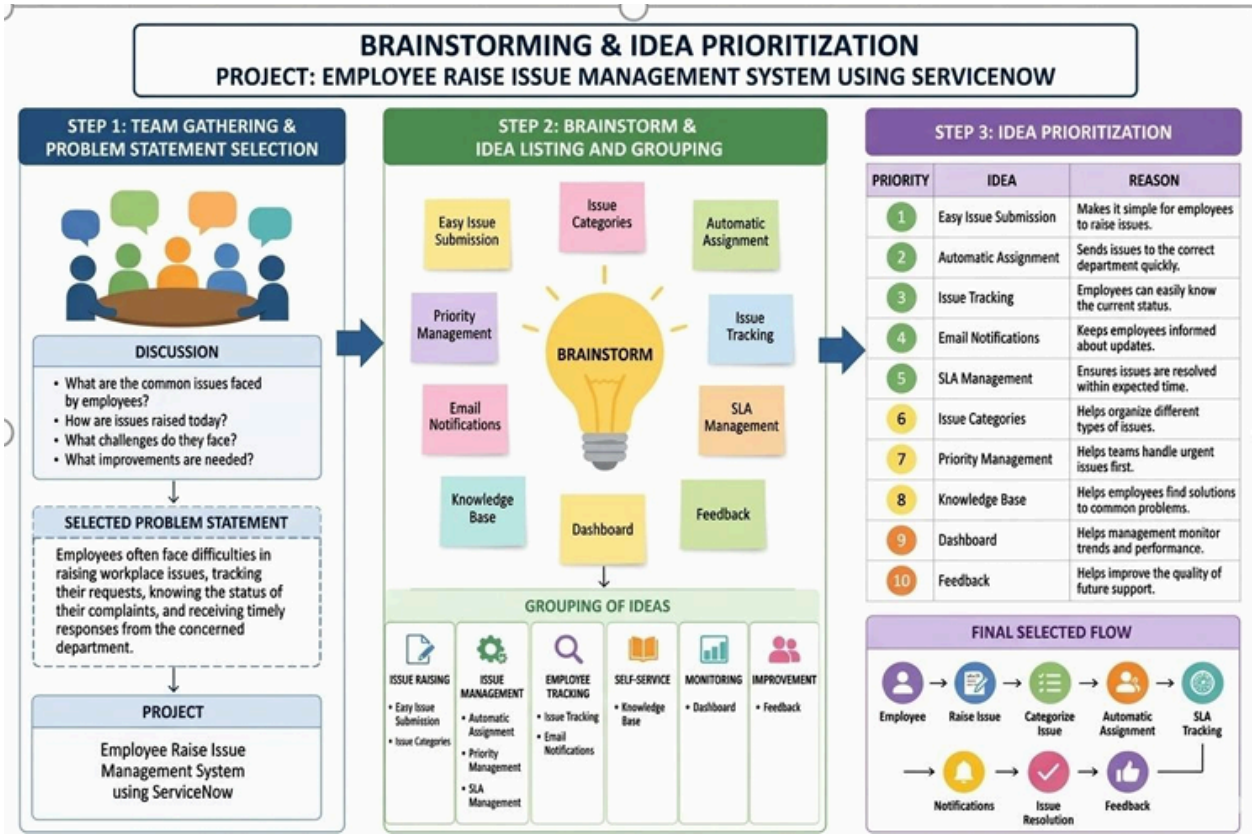

Employees need a centralized system where they can submit workplace service requests, select the appropriate request type, monitor progress, communicate with the support team, and receive timely updates until the request is completed.

Project:

Employee Raise Issue Management System using ServiceNow

Employee Raise Issue Management System using ServiceNow:

The team analyzes employee requirements and identifies important areas such as request submission, department assignment, priority handling, progress monitoring, notifications, and service improvement.

Step-2: Ideation, Feature Categorization and Structuring :

During the brainstorming session, the team explores various user-focused features to build a seamless and intelligent employee helpdesk system.

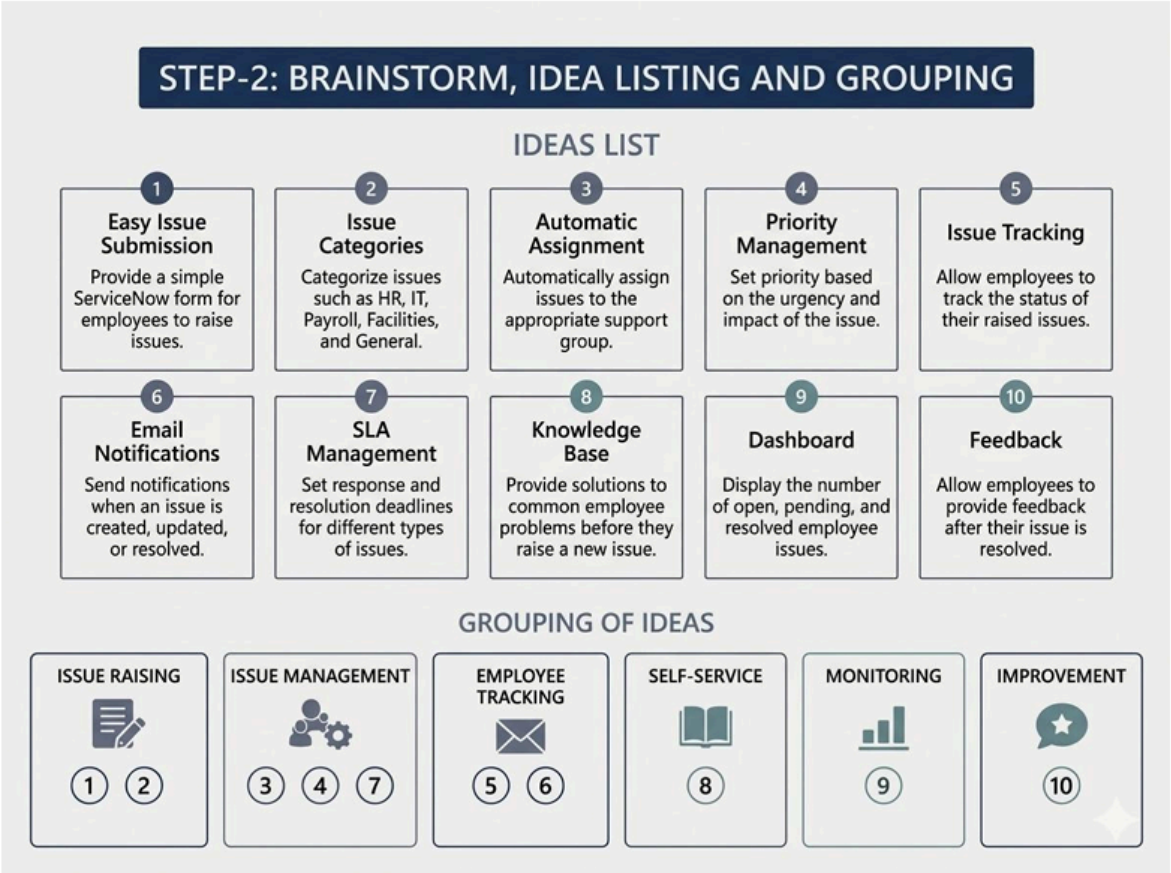

Feature/Idea	Description
Intuitive Intake Portal	A simplified, user-friendly interface for employees to log their workplace issues quickly.
Smart Classification	Enables users to categorize their problems (e.g., IT, HR, Facilities) for clearer processing.
Intelligent Routing	Automatically dispatches the ticket to the specialized support group based on the issue type.

Severity Mapping	Gauges the impact and critical nature of the issue to automatically assign priority levels.
Live Progress Tracke	Provides real-time visibility into the ticket lifecycle (e.g., Logged, Assigned, Resolving, Closed).
Instant Notifications	Sends automated email or chat alerts upon ticket creation, updates, or resolution milestones.
SLA Breach Prevention	Triggers automated alerts and escalates the ticket if response times exceed defined thresholds.
Knowledge Base Integration	Offers a repository of FAQs and troubleshooting guides for quick self-resolution.
Operational Analytics	A centralized console for managers to track ticket influx, resolution rates, and team workload.
Experience Feedback	Collects post-resolution ratings and reviews to measure and improve support quality.

Service Rating Allow employees to provide a rating after their request is completed.

Grouping of Ideas :

- **Intake Channel:** Intuitive Intake Portal, Smart Classification
- **Operations Workflow:** Intelligent Routing, Severity Mapping, SLA Breach Prevention
- **User Engagement:**Live Progress Tracker, Instant Notifications
- **Self-Help Hub:** Knowledge Base Integration
- **System Analytics:** Operational Analytics
- **Quality Assurance:** Experience Feedback

Step-3: Idea Prioritization :

Priority	Feature/Idea	Reason
High	Intuitive Intake Portal	Optimizes the ticket logging speed for distressed employees.
High	Issue Categories	Automatically segmenting topics avoids chaotic backend sorting hops.
High	Automatic Assignment	Eliminates human intervention delay by routing tickets directly to tech groups.
High	Priority Management	Critical tickets get instant attention by analyzing impact and urgency metrics.
High	SLA Management	Keeps engineering teams compliant under strict corporate resolution windows.
Medium	Email Notifications	Keeps both technicians and users

		synchronized on development milestones.
Medium	Dashboard	Provides system administrators a bird's-eye view of operational bottlenecks.
Medium	Knowledge Base	Filters out simple routine queries through early self-service deflection grids
Medium	Issue Tracking	Reduces duplicate follow-up inquiries as users can see real-time updates.
Low/Medium	Feedback	Collects user experience indices to measure service growth pipelines over time.
