Project Design Phase
Proposed Solution

Date	16 August 2026
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	2 Marks

Proposed Solution Framework

S.No.	Strategic Parameter	Architectural & Operational Specification
1	**Problem Statement** *(Core Inefficiency)*	Employees in enterprise environments frequently report workplace issues via unstructured, fragmented channels like email, chat, or verbal requests. This dynamic causes incomplete data capture, poor visibility, delayed ticket resolutions, and inconsistent routing/prioritization. Organizations require a single, formalized, and centralized mechanism to systematically ingest and track internal employee issues.

2	**Solution Description** *(Target State)*	Implement a native **ServiceNow Employee Issue Record Producer** embedded within the **Service Portal**. This delivers an intuitive, standardized intake form for employees while completely abstracting the backend data structure. The solution enforces data integrity via client-side validations, manages a strict Category–Subcategory dependency matrix, and automates structured record creation within a dedicated custom table.
3	**Novelty & Differentiation** *(Unique Value)*	The architecture bridges user-centric portal design with secure database-level isolation. Instead of relying on manual email processing, it leverages native ServiceNow engines to enforce conditional logic, dynamic field validation, and automated variable-to-field data mapping at the exact point of ingestion.

4	**Operational & Cultural Impact** *(User Satisfaction)*	Elevates the internal employee experience by providing a transparent, predictable, and simplified intake channel. By eliminating ad-hoc communication, it improves data consistency, establishes a reliable foundation for tracking SLAs, and significantly minimizes the administrative triage overhead for support teams.
5	**Business Value Model** *(ROI Framework)*	As an internal-facing enterprise workflow, the solution optimizes operational efficiency rather than generating direct revenue. Value is realized by maximizing existing platform licensing, reducing the time-to-resolution (MTTR), mitigating data loss, and driving down the labor hours required to manual-sort fragmented requests.
6	**Enterprise Scalability** *(Future Growth)*	Designed with a decoupled architecture that easily scales to accommodate new business units, custom fields, assignment groups, and multi-stage approval workflows. The foundational portal design and configuration blueprint can be rapidly duplicated to digitize other internal

		service processes across the enterprise.

Now that the entire **Software Design Document (SDD)** components are fully polished, would you like me to:

- Generate a **UAT (User Acceptance Testing) Test Plan** with test cases mapping to these requirements?
- Draft the **ServiceNow Client Scripts and UI Policies code snippets** needed for the dynamic field validation?
- Compile all the sections we have rewritten into a **single, final comprehensive report**?

Let me know your next step to move this project forward!
